### PATENT COOPERATION TREATY

PCT

From the INTERNATIONAL BURFALL

NOTICE INFORMING THE APPLICANT OF THE COMMUNICATION OF THE INTERNATIONAL APPLICATION TO THE DESIGNATED OFFICES REICHEL, Pavel P.O. Box 52 111 21 Praha 1 RÉPUBLIQUE TCHÈQUE

(PCT Rule 47.1(c), first sentence)

Date of mailing (day/month/year)

21 January 1999 (21.01.99)

Applicant's or agent's file reference

2584/1 BLAZEK

\_\_\_\_

IMPORTANT NOTICE

International application No. PCT/CZ98/00030 International filing date (day/month/year)
09 July 1998 (09 07 98)

Priority date (day/month/year) 10 July 1997 (10.07.97)

Applicant

BLAZEK Dalibor

Notice is hereby given that the International Bureau has communicated, as provided in Article 20, the international application
to the following designated Offices on the date indicated above as the date of mailing of this Notice:
 AU.BR.CA.CN.F.P. ILIS

In accordance with Rule 47.1(d. third sentence, those Offices will accept the present Notice as conclusive evidence that the communication of the international application has duly taken place on the date of mailing indicated above and no copy of the international application is required to be furnished by the applicant to the designated Office(s).

The following designated Offices have waived the requirement for such a communication at this time: DE,HU,MX,NZ,PL,RU,SLSK,TR,UA

The communication will be made to those Offices only upon their request. Furthermore, those Offices do not require the applicant to furnish a copy of the international application (Rule 49.1(e-bis)).

- 3. Enclosed with this Notice is a copy of the international application as published by the International Bureau on
  - 21 January 1998 (21.01.99) under No. WO 99/02064

### REMINDER REGARDING CHAPTER II (Article 31(2)(a) and Rule 54.2)

If the applicant wishes to postpone entry into the national phase until 30 months (or later in some Offices) from the priority distribution of the priority distribution of the priority distribution of the priority distribution of the priority distribution provided in the priority data.

It is the applicant's sole responsibility to monitor the 19-month time limit

Note that only an applicant who is a national or resident of a PCT Contracting State which is bound by Chapter II has the right to file a demand for international preliminary examination.

### REMINDER REGARDING ENTRY INTO THE NATIONAL PHASE (Article 22 or 39(1))

If the applicant wishes to proceed with the international application in the national phase, he must, within 20 months or 30 months, or later in some Offices, perform the acts referred to therein before each designated or elected Office.

For further important information on the time limits and acts to be performed for entering the national phase, see the Annex to Form PCT/8F301 (Notification of Receipt of Record Copy) and Volume II of the PCT Applicant's Guide.

The International Bureau of WIPO 34, chemin des Colombettes 1211 Geneva 20, Switzerland Authorized officer

#### File, particularly nail file

#### Field of the invention

The invention involves a file, particularly for nails, manufactured from glass.

#### Description of the prior art

Nail files, which are among the principal components of the various sets of cosmetic equipment, are at the present time manufactured from various metals or their alloys, from paper or fabric with a rough finish, as the case may be. Since files destined for such purposes are often used in an environment with high humidity, for example during personal hygiene in the bathroom, it happens in some cases that they corrode or the material from which the file is made becomes moist resulting, on the one hand, in a deterioration in appearance and, on the other, a dulling of the cutting edges of the file from the effects of corrosion and humidity and, thereby, a basic loss of effectiveness. If non-corrosive materials are used in the manufacture of files, which is generally the case, then the disadvantage is the high price. The disadvantage of metal files in which the cutting edges are formed by mechanical means is also the limited "smoothness" of the file, and the fact that by mechanical means it is possible to produce only a limited degree of roughness of the abrasive surface. Likewise, it is simply not possible to produce a series of files with finely graded roughness. It is convenient, in the use of a file, that the side edges be functional, that is rough. Because metal files are flat and too thin, it is not practical to use their side edges to trim the nails.

#### Summary of the invention

The above disadvantages are eliminated in the file according to the invention presented here, the basis of which lies in the fact that it is made from glass roughened on at least part of its surface, with a roughness varying from 10 to 100 µm.

The advantage of such a file is its absolute resistance to the environment in which it is used. It is significant too that, given its non-corrosive properties, the abrasive surfaces can be kept clean by rinsing in water.

It is important to note here the wide range of surface roughness that can be attained, varying from the smoothest finish with a roughness of 10 μm to a roughness of around 100 μm.

The glass body of the file has an oblong board shape and has a point at one end at least. The advantage of such a shape for the glass body of the file is the ease of manipulation in use and, thanks to the point, its practical value for hand hygiene is increased.

Another advantageous solution to be noted is the fact that the glass body of the file is roughened along one whole side at least, having a V-shaped point at the end. The advantages of such a file are apparent both during use of the file and during its manufacture, when roughening of the whole surface is carried out without the need, for instance, to mask part of the surface during the roughening process by use of acid engraving for example. The point is formed in a V shape, its symmetrical shape facilitating manipulation during use of the file in either the left or the right hand.

A further advantageous feature is the fact that body of the file is roughened along one whole side at least and is ground to a sharp finish on at least one edge. The longitudinal edge formed on one side of the body of the file further increases the functional possibilities of the nail file.

It is possible to form the body of the file so that both edges are bevelled, while the bevelled edge at the end is at an oblique angle to the side edge, so that together they form a point. This variation further increases the wide range of uses for the file.

Another advantageous arrangement for the shape of the body of the file, consisting in the fact that the surface of at least one of the edges and of one end of the body of the file is also roughened, further contributes to increasing its usefulness.

To further improve performance, the edges of the body of the file are rounded. These variations in the shape of the glass file further extend its usefulness for special cases of hand hygiene.

From the point of view of production technology, it is an advantage if the body of the file can be formed from flat or pressed glass.

All the various shapes of the file can have a glass body formed from hardened glass. The advantages of such a treated glass body are its increased stability and particularly increased safety in the event of breakage of the whole of the glass body by dropping etc. The hardening of the glass-bodied file gives it properties which are well-known in such treated glass.

#### Brief description of the drawings

The invention can be better described by means of the drawings, of which Figure 1 represents an "axonometric overview of the glass body of the file. Figure 2 presents a cross section of the glass body of the file with roughening on one surface. Figure 3 also shows a cross section of the glass body of the file with roughening on one side and rounded edges. Similarly, Figure 4 presents a cross section of the glass body of the file, both of whose edges are bevelled.

#### Description of the preferred embodiments

The file according to Figure 1 is formed from a glass body  $\underline{1}$ , shown here in oblong board shape, with a roughening  $\underline{4}$  on the surface  $\underline{2}$ . The roughening  $\underline{4}$  is produced by a wide variety of techniques, the choice depending upon the degree of roughness. To produce the smoothest finish, for example around  $10 \, \mu m$ , a chemical process can be used, such as acid engraving with a hydrogen fluoride solution. Greater roughness, of around  $100 \, \mu m$  for instance, can be produced mechanically, by sanding for example. Figure 2 shows a cross section of the glass body  $\underline{1}$  of the file illustrated in Figure 1, with a roughened finish 4 along the whole of one surface 2.

Figures 3 and 4 illustrate further possible variants on the glass body  $\underline{1}$  of the oblong board-shaped file. A cross section is shown of the glass body  $\underline{1}$  of the file, with roughening  $\underline{4}$  of one surface finish  $\underline{2}$ , the glass body  $\underline{1}$  of the file having rounded edges  $\underline{3}$ , while the cross section in Figure 4 presents the glass body  $\underline{1}$  of the file with edges  $\underline{3}$  bevelled to a sharp finish, the glass body  $\underline{1}$  of the file having a rough finish  $\underline{4}$  on both surfaces 2.

#### Industrial use of the invention

The glass-bodied file has been described from the point of view of its use as a nail file. This example of use, however, in no way excludes further possible uses in other fields, particularly given the wide range of roughness which can be achieved in the glass-bodied file. A file produced according to this invention with a low degree of roughness, that is to say the finest, can be used in polishing surfaces, for example, while the coarsest can be used for grinding.

#### CLAIMS

- A file, particularly a nail file, characterized by the fact that the body (1) of the file is made of
  glass and is roughened on at least part of its surface (2), with a roughness varying from 10 to 100

  µm.
- A file according to claim 1, characterized by the fact that the body (1) of the file has an oblong board shape and at least at one of its ends a point (5).
- A file according to claims 1 or 2, characterized by the fact that the body (1) of the file is roughened at least along the whole of one side, while the point (5) at the end is V-shaped.
- A file according to claims 1 or 2, characterized by the fact that the body (1) of the file is
  roughened at least along the whole of one side and is bevelled to a sharp finish on at least one
  edge (3).
- 5. A file according to claim 4, characterized by the fact that both edges (3) and at least one end of the body (1) of the file are bevelled, while the bevelled edge at the end is at an oblique angle to the side edge, so that together they form a point.
- 6. A file according to claim 4, characterized by the fact that the surface of at least one of the edges (3) and of one end of the body (1) of the file is also roughened.
- 7. A file according to claim 4, characterized by the fact that the edges (3) are rounded.
- A file according to any of the above claims 1 to 7, characterized by the fact that the body (1) of the file is made of flat glass.
- A file according to any of the above claims 1 to 7, characterized by the fact that the body (1) of the file is made of pressed glass.
- 10. A file according to any of the above claims 1 to 9, characterized by the fact that the body (1) of the file is made from hardened glass.

#### AMENDED CLAIMS

[received by the International Bureau on 10 December 1998 (10.12.98); original claim 1 amended; remaining claims unchanged (1 page)]

- A file, particularly a nail file, characterized by the fact that the body (1) of the file, including its surface (2), is formed of a single, integral stratum made of glass, where the abrading surface is situated on at least part of the surface (2), with a roughness varying from 10 to 100 μm.
- A file according to claim 1, characterized by the fact that the body (1) of the file has an oblong board shape and at least at one of its ends a point (5).
- A file according to claims 1 or 2, characterized by the fact that the body (1) of the file is roughened at least along the whole of one side, while the point (5) at the end is V-shaped.
- 4. A file according to claims 1 or 2, characterized by the fact that the body (1) of the file is roughened at least along the whole of one side and is bevelled to a sharp finish on at least one edge (3).
- 5. A file according to claim 4, characterized by the fact that both edges (3) and at least one end of the body (1) of the file are bevelled, while the bevelled edge at the end is at an oblique angle to the side edge, so that together they form a point.
- 6. A file according to claim 4, characterized by the fact that the surface of at least one of the edges
  (3) and of one end of the body (1) of the file is also roughened.
- 7. A file according to claim 4, characterized by the fact that the edges (3) are rounded.
- A file according to any of the above claims 1 to 7, characterized by the fact that the body (1) of the file is made of flat glass.
- A file according to any of the above claims 1 to 7, characterized by the fact that the body (1) of the file is made of pressed glass.
- 10. A file according to any of the above claims 1 to 10, characterized by the fact that the body (1) of the file is made from hardened glass.

#### Statement under article 19 (1)

The amendment to Claim 1 reflects the principal innovative feature of the file described in International application No. PCT/CZ 98/00030, i.e. the fact that the working surface is directly formed from the same material and is an integral part of the body of the file. This feature distinguishes it from the other technical solutions cited and constitutes an inventive step qualifying the device for patent protection.

By contrast to this simple integral structure as indicated in amended Claim 1, the nail file described in US Patent No. 5,361,786 has a multi-bead glass surface attached to a substrate formed, for example, from silicone polymer. Likewise, the subject of Canadian Patent No. 2,142,949 consists of a substrate of fibreglass material with diamond particles electroplated to the top surface thereof. US Patent No. 2,699,791 involves a device formed from coated abrasive sheets bonded to thin strips of sheet metal or wood. Compared to the structural complexity of these other inventions, the technological simplicity of the invention described in Application No. PCT/CZ 98/00030 results in reduced production costs. Further important characteristics resulting from this integral structure are the good functional features and the fact that the file is absolutely resistant to the environment in which it is used.

Reference will be made to the amended claims, in a revised version of the description, by insertion of the appropriate wording in the first paragraph of the Summary of the invention, on page 1 of the Application.

The structure of the file in question is not obvious to a person skilled in the art, and consequently involves an inventive step. In our opinion, the file according to International application No. PCT/CZ 98/00030 is simpler and therefore cheaper to produce than the current multi-layer nail files. Its present absence from the market is a further indication that the structure of the file is not obvious
